CSA1020-SOFTWARE ENGINEERING

Exp 5- Use the following requirements for a Library Management System:

 Add a feature to search books by title and author.

 Implement an online book reservation system.

 Generate monthly reports on borrowed books for

administrators.

 Enable email notifications for overdue books.

 Add support for QR code scanning for borrowing and

returning books.

 Create a user-friendly dashboard for librarians.

 Allow users to review and rate books.

 Integrate a chatbot for user assistance.

 Develop a mobile app version of the system.

 Provide multi-language support.

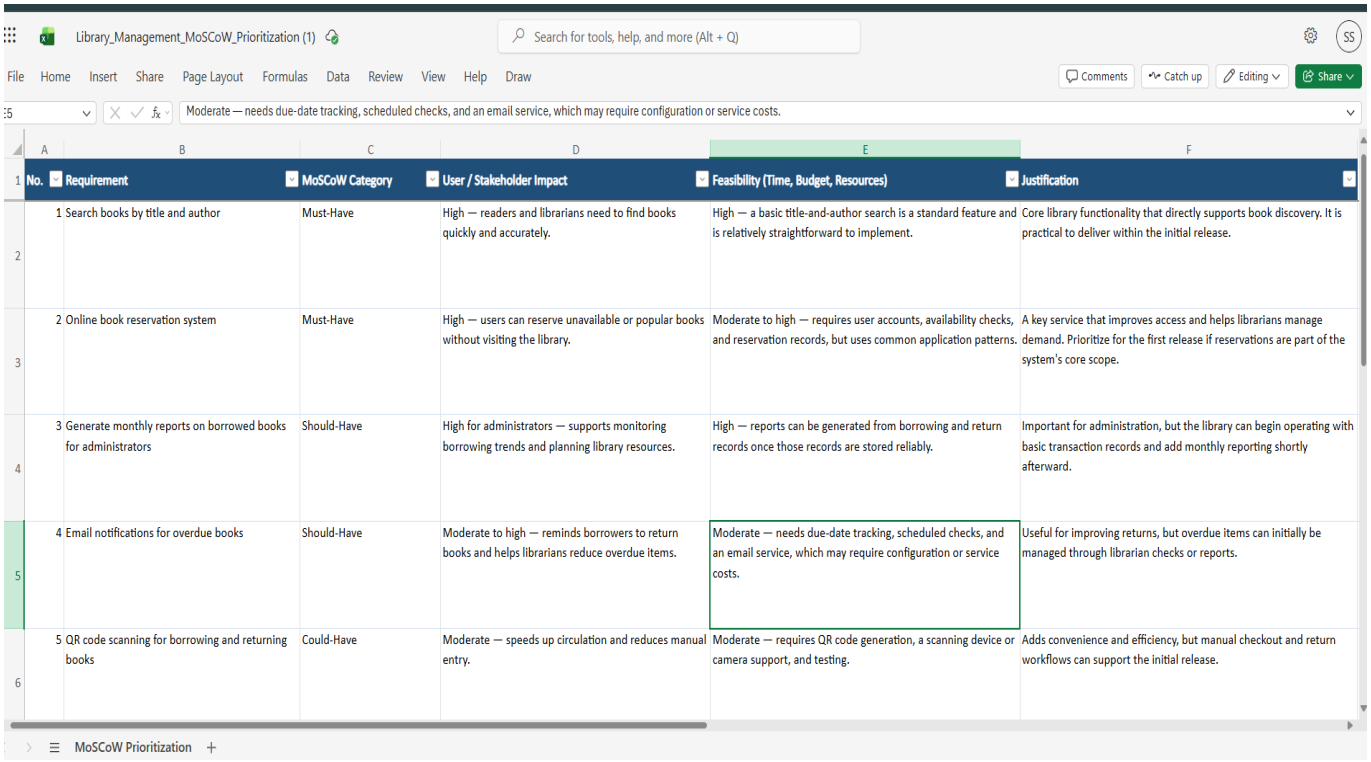

Categorize each requirement using MOSCOW Method (Must-Have,

Should-Have, Could-Have, or Won't-Have) based on the following

criteria: Impact on the users and stakeholders.Feasibility considering time, budget, and resource constraints.Finally Submit the completed Google Sheet or Excel file with all

requirements categorized and justified.

.

No.	Requirement	MoSCoW Category	User / Stakeholder Impact	Feasibility (Time, Budget, Resources)	Justification
1	Search books by title and author	Must-Have	High — readers and librarians need to find books quickly and accurately.	High — a basic title-and-author search is a standard feature and is relatively straightforward to implement.	Core library functionality that directly supports book discovery. It is practical to deliver within the initial release.
2	Online book reservation system	Must-Have	High — users can reserve unavailable or popular books without visiting the library.	Moderate to high — requires user accounts, availability checks, and reservation records, but uses common application patterns.	A key service that improves access and helps librarians manage demand. Prioritize for the first release if reservations are part of the system's core scope.
3	Generate monthly reports on borrowed books for administrators	Should-Have	High for administrators — supports monitoring borrowing trends and planning library resources.	High — reports can be generated from borrowing and return records once those records are stored reliably.	Important for administration, but the library can begin operating with basic transaction records and add monthly reporting shortly afterward.
4	Email notifications for overdue books	Should-Have	Moderate to high — reminds borrowers to return books and helps librarians reduce overdue items.	Moderate — needs due-date tracking, scheduled checks, and an email service, which may require configuration or service costs.	Useful for improving returns, but overdue items can initially be managed through librarian checks or reports.
5	QR code scanning for borrowing and returning books	Could-Have	Moderate — speeds up circulation and reduces manual entry.	Moderate — requires QR code generation, a scanning device or camera support, and testing.	Adds convenience and efficiency, but manual checkout and return workflows can support the initial release.
